

BITAQA

Admin Portal

UX/UI Case Study.

▣ Rebuilding at Speed *(Scope)*

Bitqa is a digital business card platform designed to scale from individual users to enterprise organizations. While the consumer side handles contact sharing, managing an entire company's digital identity footprint requires a centralized administrative hub.

Working alongside a developer, I worked on the complete UX/UI overhaul of the admin web application.

WEEKS, DESIGN TO SHIP

Role: UX/UI Designer

Team: 1 Designer + 1 Full-Stack Developer

Company: iSolution

Platform: Desktop Web Application

▣ The Portal Had Outgrown Its UI *(Discovery)*

When I joined the project, Bitaqqa was still a work in progress, and I had worked on several features before while following the original visual direction.

As the project grew, problems became harder to ignore. The interface felt heavy, leading to simple admin tasks being more complicated than they should.

After several discussions across the company, we agreed to do a new direction focused on a functional admin portal that followed clarity and ease of use.

One of the few images showcasing the old design

▣ **The Problem Was Bigger Than Visuals** *(Product Audit)*

The original admin portal suffered from poor design execution and alignment issues. It also did not follow a specific design system which made the whole interface feel unbalanced.

Oversized Components: Large visuals took up too much space and reduced the amount of useful information visible at once.

Inconsistent Spacing: Spacing and alignment changed from one area to another, making otherwise simple tasks harder to navigate.

Weak Hierarchy: Content often competed for attention instead of guiding the user, making the interface harder for admins to scan.

Visual Clutter: Excessive decorative shapes and UI elements distracted from what was meant to be a functional admin tool.

These audit findings made it easier to fix what's needed quickly and efficiently. Keeping in mind that it's an admin portal, made us focus on the function more than the visuals while still maintaining a balance between them.

▣ Fix the Foundation First *(Define)*

The redesign needed to simplify the experience instead of rebuilding the product from scratch.

Clarity

Function before decoration.

Consistency

Shared patterns across the portal.

Scalability

Support existing and future features without creating more UI debt.

Feasibility

Work within the existing backend, frontend and development setup.

To set these priorities, the developer and I reviewed the old design in detail to understand its logic and identify gaps.

Another one of the few images showcasing the old design

▣ One Design Language *(Strategy & Foundation)*

The developer already had access to a ready-made design system that would make implementation easier for him.

Rather than rebuilding every component from scratch, I adapted it to Bitaq'a's branding and reused it across the redesign, saving us a lot of time.

The Design System

▣ **Designing in Parallel** *(Ideation & Prototyping)*

There was no need to start with basic wireframes as this was an existing product.

Design and development progressed almost in parallel, allowing us to quickly review and adjust as we went.

We also held almost daily meetings with the wider team, keeping them updated and taking their live feedback into consideration.

▣ From Cards to an Overview (*The Solution*)

Dashboard

Instead of only displaying user cards as in the old design, I focused on an overview with stats and access to the users in table form, making important information easier to scan.

- **Stat Cards:** Tracking total cards, opened & shared cards, and recently updated cards.
- **Data Visualization:** Dedicated charts monitoring card allocation and engagement over time.
- **Activity Table:** Quick access to the latest cards added to the system.

Dashboard

One Profile, 3 Formats *(The Solution)*

Users & Card Management

Managing a user also meant managing how their information appeared across different card formats.

- **User Directory:** A table-based user list with the option to edit each user's information.
- **Multi-Format Previewing:** Integrated previews allowing admins to inspect how a profile renders as a Web Card, Mobile Card, or Physical Card.

User Edit

Web Card

Same Logic, Different Tools

(The Solution)

Admin Tools

Beyond users and cards, the portal covered the wider admin experience through departments, groups, branches, company management, reports and history, with additional configuration tools grouped under Settings.

Although these areas served different purposes, I kept a consistent layout so that admins could move through the system intuitively without having to relearn the interface.

Reports

Branch Edit

▣ **Validated, Not Tested** (*Outcome & Reflection*)

The redesign was completed quickly and validated internally, but you know that isn't the same thing as usability testing with real administrators.

Internal Review

After the first version was implemented, we reviewed it with the wider team, including designers, developers, marketing and the head of the CEO office. The new direction was received positively, especially for being cleaner and less visually straining.

Outcome

The redesign covered more than 20 screens and was designed and implemented in around two weeks through close collaboration with the developer.

What I'd Do Next

We didn't conduct formal usability testing with actual administrators. With more time, I would test the main workflows with real admins to evaluate navigation and then improve the experience based on their feedback.
