
BLOODMOON
ESCAPE ROOM

Communication should keep players inside the experience.

[Overview · Problem]

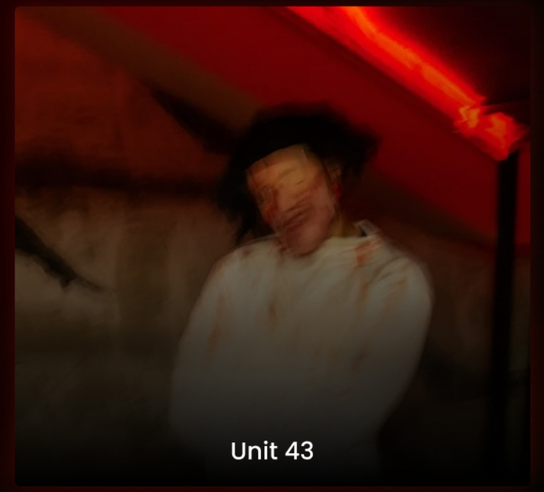

Bloodmoon is a scare house where controllers watch players and actors through cameras and communicate with players using room phones.

They used Discord to chat, but players often left the app and struggled to return. Unwanted photos and voice messages also disrupted communication and broke the atmosphere.

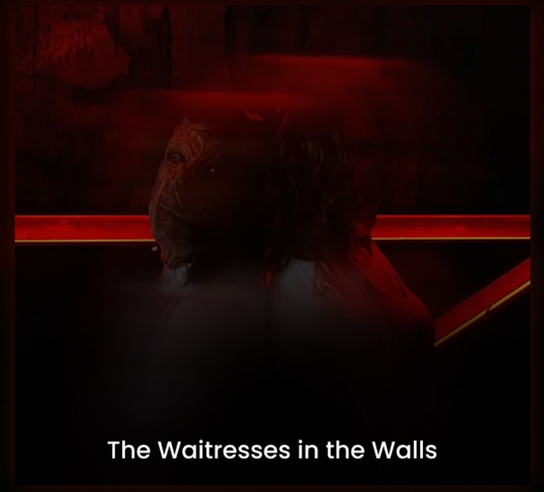

Based on problems shared by my friend, who worked there, I designed a dedicated player app and controller interface for a proposed kiosk setup.

Role	UX/UI designer
Status	Development paused

Players stay in the chat. Controllers set the pace.

[Player Experience · Interaction Design]

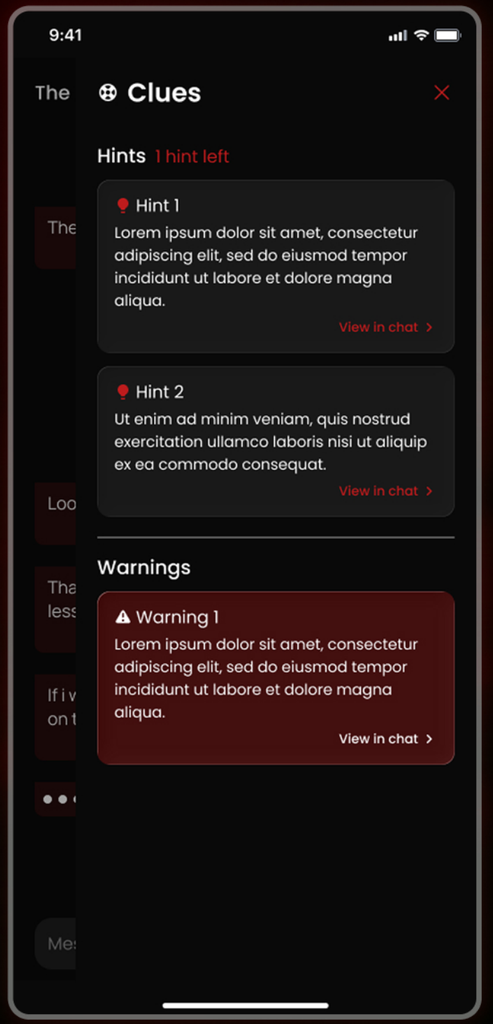

Staff select the room before the game. Players then stay in that room's chat, with text-only messaging and no option to switch rooms.

Hints and warnings appear in the conversation and remain accessible through the Clues panel.

I kept the timer off the player interface to preserve immersion. Controllers decide when to share the remaining time, keeping control over the tension.

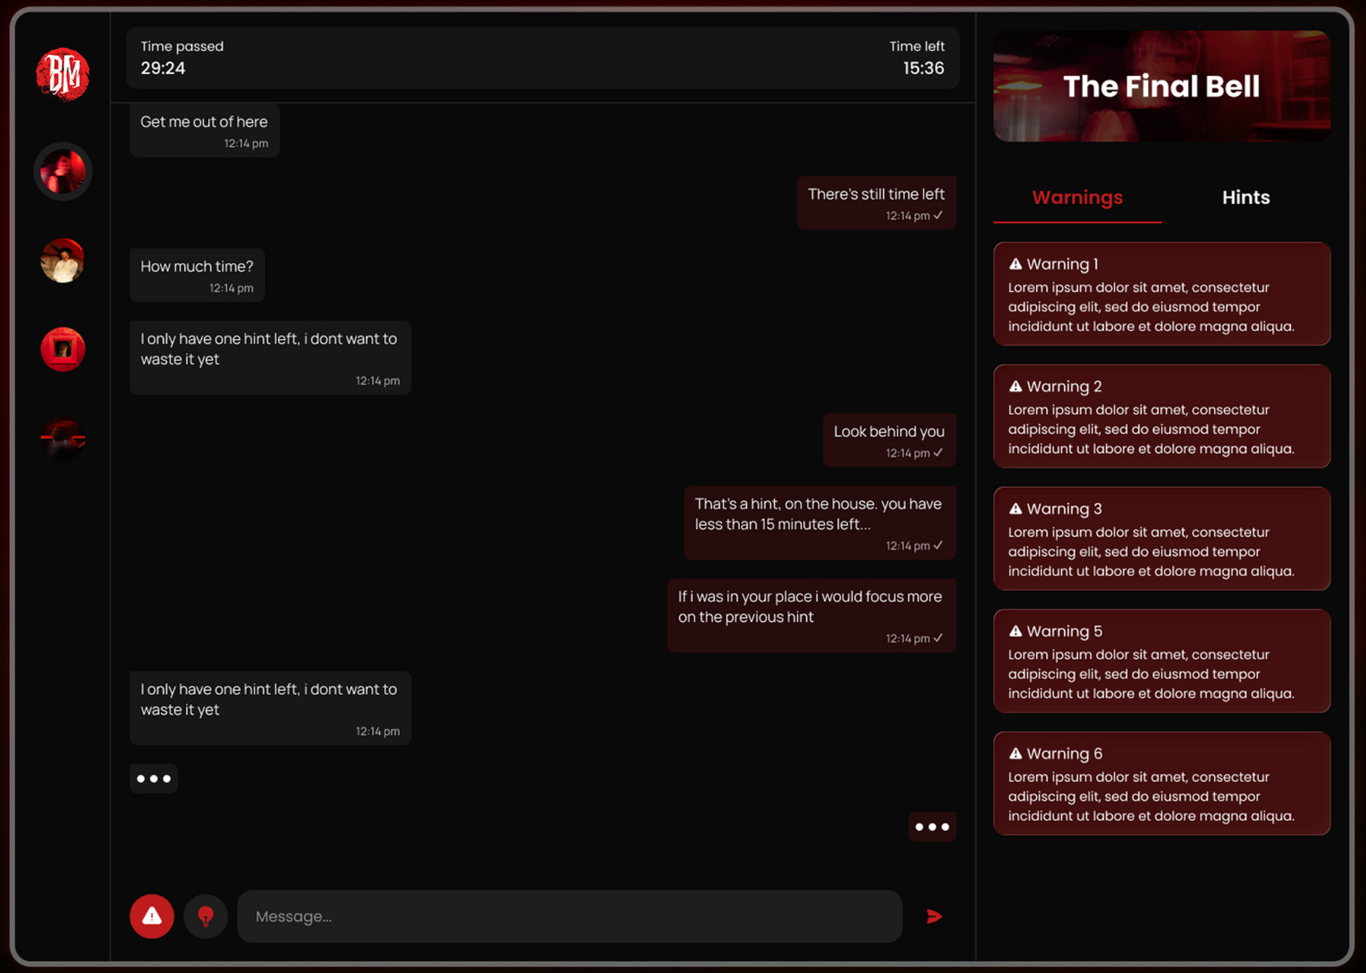

Controllers manage rooms, timing, and clues in one place.

[Controller Experience · Interaction Design]

Controllers can switch between room conversations and view the elapsed and remaining time for the selected room.

Each room has prepared hints and warnings based on common moments in the game. Controllers drag them into the chat to send them without retyping.

For situations that need a different response, controllers can type a custom message and choose to send it as a hint or warning.

The component system grew alongside the screens.

[Design System · Project Status]

I started with a simple system using Bloodmoon's red-and-black branding, then added reusable cards, buttons, and chat components as I designed both interfaces.

My friend (the developer) reviewed the designs and responded positively to the interface and interaction choices.

The design work was completed, but development is currently paused. The app was not tested in real use.
